**Subject:** Catching Up

Dear Jeffrey

I hope you've been well. I wanted to update you on what I've been up to for the last two years. I was also hoping to talk with you to see if I might use the foundation's Lexington office conference room from time to time for my work and what I could provide in exchange for that. I am cc'ing Rich because I'm not sure if you still use this email?

Since working for your foundation, I continued to publish as a journalist writing mostly about genetic vectors (*Newsweek, Techonomy* etc). I then set up an LLC that provides business development for labs that have reversed age-driven or degenerative diseases. Most of the therapies are genetic vectors, and have to show remarkable results at the mouse level and beyond. Regenerative medicine is a rapidly evolving field, and one that forces the medical industry to shift their focus from addressing symptoms of disease to fundamental evolutionary shortfalls.

So far, I placed a genetic vector at the National Institute of Medicine in France (that reversed glaucoma in mice using the neuroglobin gene) under formal licence review with a publicly traded pharma group here in the US. And I am collaborating with a lab at the University of Pittsburgh that has reversed cirrhosis/ end stage liver disease in rats using the master transcription gene in hepatocytes. The concept of the latter gene vector is really intriguing in that a master transcription gene completely restored liver function by rebalancing genetic expression and thus proteostasis.

While I don't really need an office at this point, I do need access to a conference room from time to time and it would be hugely helpful if I could access the foundation's. If there was some work that I could do for the foundation in exchange, I would be delighted to do that.

It would be wonderful to catch up with you as well.

all the best,
