Subject: Airplane Satellite Phone

looks to me like "011♦=9D needs to be added to make a call to the 881 number on the plane when =alling from the US!

JANUARY 9, =015

Satellite=phone numbers are different from land and cellular systems. Each =atellite provider has a unique prefix followed by an eight or nine =igit number. For Iridium, the number would begin with 8816 followed by =ight digit phone number, Inmarsat begins with 870 followed by nine =igit phone number, and Thuraya begins with 882 16 followed by an eight =igit number. In addition to the prefix and phone number, callers must =now and use international dialing codes. To call out from an =ridium, Inmarsat, or Thuraya satellite phone, the caller needs a clear =iew of the sky and the phone should be registered to the satellite =etwork. When the phone is ready to dial enter 00 plus the country code =nd phone number:

For Example: 001 954 973 3100.

To call an Iridium, =nmarsat, or Thuraya satellite phone, the caller needs to enter the =nternational dialing code (i.e. In United States use 011, In Europe use =0, Etc*) and satellite phone number:

* Calling from =S to an Iridium phone: 011 8816 =1049999
