**Subject:** Info on selphyl

Selphyl™ is a patented technology using patient's own blood platelets to increase skin volume and trigger new collagen growth. During treatment, a small amount of blood is collected and separated into a concentration of platelets and fibrin or PRFM (Platelet-rich Fibrin Matrix). The PRFM is then injected back into the skin to increase and restore skin volume. Because Selphyl™ uses patient's own platelets instead of artificial materials, there is virtually no risk of allergic reaction. This natural procedure is performed by Dr. Tanne in her office and takes only about 20 minutes, rejuvenating without swelling, bruising or lumping. Increased skin volume and amazing rejuvenation occurs over a few weeks as new collagen and blood vessels develop - while your own tissues virtually reverse the signs of aging naturally.
