It's hard to tell w/o proper code/documentation (couldn't=find much online). In general the four things are:

1) the devil is in the details, meaning that even if in theory it's all solid the implementation might have bugs. There's no definitive technical solution for that though

2) anything that is "custom" (eg: they have a custom wifi protocol) is a red flag because it means that it hasn't been properly vetted and might be broken/buggy

3) there aren't enough=details online to tell but it seems to me that to speed up the blockchain =erification they partially centralize the network by using their own "supernodes" (essentially the wallets talk to the supernodes vs the ac=ual blockchain). The security of those servers seems key to me and they gl=ss over it online

4) the mesh network implementation is completely up in the air (judging from what's public) and it could go horribly wrong. So that needs further verification

Also (5), in general the disadvantage of distributed /open things is that it is a lot easier to steal money vs a closed network (like swi=t).

Are you looking to invest into this thing? If=so , I'd suggest a few things:

A)=because problem (1) above is not completely solvable, they need to have a plan. Part of it is technical (do continuous code auditing, pentestin=, on board proper crypto people, etc), the other part is legal/financial a=d pr. Specifically they should have some kind of insurance and they should=have a pr disaster recovery plan. A big disadvantage of decentralized syst=m is that you don't have anybody to trust and you don't have a clo=ed network that can make stealing money hard, they need to address that♦=A0

B) realistically nobody is going to attack them until they become significant enough from a financial standpoint. This gives them time to work on A. That said they should avoid making enemies (the="disgruntled" hacker type)

Hope this is useful, if you get more stuff from them I'm happy to look into it more. Also if you do invest I can help them with (A) if needed.

It's a very dumb platitude but "security is = process" is true.

Unrelated: checkout=edge.org <<http://edge.org/>> , I think you'll like it. There's a short video with Minsky that is absolutely fantastic
