also was thinking, why don't we just create a cool temporary drug tha= raises core temp to like 108 degrees for 2 hours? that would kill all ac=ive bugs without dentauring our proteins. fever doesn't kill us. (what's=annoying is the cooling part, we do that for brain stuff and when we "tha=" people bad things happen). anyway, i think nature was on that path with=interleukins but it didn't quite get there since fever usually is only to=100 or 101. would be cool: reversible thermoregulation as a treatment for=acute hematogenous pathogen eradication

ok i'm going to sleep. getting cranky over here. tired of people pick=ng on me.
