i am well aware of the diffrence betwenn ac and dc convers=on, you say that there was not enough ac power for a residential =ystem what i asked was what power there was in re 100 60 hz

Jeffrey -

Because we do not have your electrical lo=d analysis book. We did look into this early on and we identified that =here was not enough 110Vac 60 hz power to support a "residential" audi= system and that an inverter would need to be installed.

Please do not confuse 28V powe=, 12 volt (13.8vdc) power and 110V, 60 hz power.

On the other hand, you do have approximatel= 68 amps of 28 v power available from the aircraft side. This power is =converted to 13.8 v (car audio capable) through the Ameriking aircraft conv=rters.\

Each of the two (2) converters installed require 30 am=s each (60 amps total), so in theory, you have approximately 8 amps surplu= of 28vDC power as overage.

So here's how it works:=/u>

<=span>

68 amps of 28vDC available on the aircraf= supply side

=/u>

Two (2) 28vDC to 13.8vDC converters are installed to provide power for the car audio amplifiers. Each of these converters require 30 amps 28vDC on the input side to produce 40 amps of 13.8vDC on the output side.

The result is that the two (2) aircraft converters are sized correctly for the existing power that the aircraft has available. =/u>

Each of these converters will provide approximately 55= watts of car audio power (13.8vDC), therefore the "600 watt" car audio will only clip at full gain, maximum draw.

#### DC amps to watts calculation

The power  $P$  in watts (W) is equal to the current  $I$  in amps (A), times the voltage  $V$  in volts (V): =/u>

$$P(W) = I(A) \times V(V)$$

not sure why the 11= watt number is still a mystery, , i thought we had it at our finger=ips as it was the limiting factor.
