I suggest the Center for Projective Co=munications. Like projective geometry of the 17th century, projec=ive communications takes into account the appearance of truth as a project=on from a context space. Though a statement appears true, it is merely = scalar projection from a complex space that involves various perspectives= Imagine a square on a plane. that is its appearance. it co=id be merely a projection of a cube or various other figures according =o the light source and its orientation. what we perceive as a true=A0 signal can be the projection from a space that includes deception= so that to break down  $1+1=2$ . it is the appearance of a 1 , t=ough each may be be the projection of another number, ie deceptio=.

``I freely confess that I never had a taste for study or re=search either in physics or geometry except in so far as they could serve as a mea=s of arriving at some sort of knowledge of the proximate causes...for the good and convenience of=life,

Girard Desargues
