the *labeled* and *unlabeled* data. The *labeled* data is used to learn a function f that maps the input x to the output y . The *unlabeled* data is used to provide unlabeled features z for the unlabeled samples. The unlabeled features z are generated by applying the learned function f to the unlabeled samples x . The unlabeled features z are then used to train a second function g that maps the unlabeled features z to the unlabeled labels y . The second function g is used to predict the labels for the unlabeled samples. The overall process is iterative, where the learned function f is updated based on the predicted labels from the second function g .
