The main valve with 4 membranes were seized =hut, the membranes were severely corroded and the end cap needed to be =hanged.

Bob told us that if the membranes tested 800 =hen it would be normal and if it test 1000 then it would be bad. Our =ain membranes tested 7000 which is pure salt water that was =ontaminating the cistern water.

Tomorrow morning at 10am =ob will come out to rebuild the manifold, change the port adapter and =ork on the intake under the dock. After the maintenance service is done =t will still run manually but the water will be purifying properly.

Bob will send a report tomorrow =fternoon.

Ann R.
