---

Drs. Cagan, Labow, and Schadt will share their groundbreaking work in precision medicine, which is changing the way diseases are diagnosed and treated. Dr. Schadt and his colleagues develop techniques to create innovative, data-driven predictive models of human disease. Investigators like Dr. Cagan can then use the data and models to devise personalized, patient-specific therapies to combat common diseases such as cancer, inflammatory bowel disease, and Alzheimer's disease. Their findings are made even more powerful when combined with the pioneering work of physicians and surgeons such as Dr. Labow, whose approach to chemotherapy is setting a new standard for treatments of some types of cancer. Their discussion will give you an insider's view on science that is changing lives—science that is happening only at Mount Sinai in New York City.
