biological analogies from complex systems.. decisions recursive interactions across a boundary, membrane=recomputing

inner thought bounded by consciousness external world. circle includes self directed reward, ==god . . external follows rules of science. hope inside parabolas out. // boundary membrane, =everything on the inside shows on boundary(conscious).

gamation. - rewards. habituation.. external motivations=br>

my authority is informed by hindsight, an inner world like a circle bounded by consciousness. a membrane separating it from the outside world. =A0 . things move across the membrane, influencing both . =A0 social physical emotional rewards.. self stimulation. religion.

1. unlike machines that turn on when the switch is thrown. . in essence =default off. biological systems are default on. they attempt to stay on. the system of excitation and inhibition is not dissimilar from adjusting the speed of a car. to make it go faster. =A0 you can either put your foot on the gas or take it off the brake. much of the early advances in medicine and psychology =A0 were during the industrial revolution, when machines were the examples. the body as a machine was the way to look and try to figure out what was going on. hydraulics for muscle . s =A0 cranes joints pulleys. . for psychological issues =A0 the machine and some of its terms became embedded in the system.=C2 thinking like a well oiled machine. input output, , computation, memory, ,

the view was that a dream state=C2 was turned on when one fell asleep/ the equivalent of going to the movies. what was on the screen was then analyzed , examined frightened amused , it was in a dark enclosed space of a room. people were able to fly. etc. I think that there is another more biological system explanation. I postulate=that dreams are ALWAYS on. running 24 hours a day, =one gets to experience them when the screen of consciousness drops away, =A0 it is that consciousness sets a screen in front of the dreams. =A0 it takes energy to keep the consciousness screen continuous, and opaque with respect to the dreams. if consciousness screen starts to fade. =A0 we can see behind and start to day dream, if we are unable to craft a screen with no holes we are fine but that takes energy and sleep to fill in the holes. without sleep the holes= form and dreams start poking their way through. schizophrenia =s a person not being

able to distinguish between dreaming and reality. =A0 he is walking in the street but he hears his mother . =the neighborhood cat might speak to him. things that everyone =xperiecents in their dreams the schizoid cannot tell the differnece=C2 his screen is damaged. the dreams behind the conciosness=screen are tied to the emotions., why am i in a bad mood , cou=d be because I am having a bad dream behind my consciousness screen, =C2 a feeling of dread, , somethin happend in my dream. etc. =. it turns out that schizoeds suffer sleep ailments. =A0 sleep deprivation causes hallucinations. (dreams whi=e awake). the conciuouess screen is tied to our senses. run =hrough focus filters. with a feedback that in some instances are hard wire=, aversion , danger,, its the acgivity behind the=screen that answers the compleix quesiotns. the aha moment is when t=e dream room sends its message to the conciouess room.

2 mus=c , most animals make sounds. what doe= music represent. it is melody prosody, inforamtion both=verticaland horizontal. chords melody. . as it is g=enerated from the brain can it be reversed engineered and used to probel th= workings of the machine tha created it. . listeing to a flut=, and its tonal quality from the sound analysisi , a lon= empty tube can be postualted. but thats only its structure,=C2 rythms are a product of the player not only the structur=. do german marches provide insite into a german mind. i= it organized regulaid. beats that range from 30 - 12 bpm. =A0 do afro americnacs. think more like jazz. =somewhat off the beat. (humor. unpredictable movements making it ha=der for a german to tackle down the field. .). wh= do soldiers march further to music, runners run further. =A0 . A symphonic structure is theme repetition vai=aion on the themes conclusion. the same dictum given to =public speakers. tell them what you are going to say, say=it , tell them what you said.

3. mathematics is =he search for truth. algorithms that do not change there=result with the passing of the day. . mathematics stands outsi=e of time. the ideal of a point or line (separte from einsteins mea=uemrnt issues as the actaul measurement is much more diffcult . requ=ring a beggining and and end therefore measurement lives in time spa=e. mathematics is the search for truth. I po=tualte that Biology and biological systems differ from mathematics beacuse=it is needs deception to survive. biological systems only make sense in ti=e space. , trying to stay away from what is the moment of life=or death. . predator prey. bieuogical system= need free energy in order to maintain structure dissintegraing from=entropy, eneygy needs to be ingested inorder to fight th= slope down to breaking apart and returning to dust. . =C2 getting energy, the most basic bio requirement. in=bio systems however the best way to get energy is either from the su=, a limtied chenical reaction or heat gradisent. the energy must com= from outside. the way for systems to gain enery is to eat it.=C2 the way not to die is to eat andnot be eaten. . the game of eat or n=t be eaten is very sophisticated what is the entity . =A0 the cell . the organ , the organism . the community on and =n. heirarchila nested systems. at every leve= decision have to be made , is it ok to sacrifice a few cells so tha= the organism can live. which cells. do they get a=choice? how many when . when the organism is eaten by it= predator. how did it try to protect itself. camaflouge,=C2 surrounding itself in junk, mimicry, misdirection, misinformation.=C2 etc.. qurum sensing game theory, free will, bait, =nts, .

4 we have come a long way in surveillance=C2 and detecting and encoding and decoding communicaions between peopl= between computers,. we can do this beacuse we can pick out t=e words in text, embed it in a grammar space,

we know=the language/ we need to do the same now for biolo=y, what is the language of the cells. do they communacat =ith proteins, . what are they saying to each other, is teh oanaguage=encrypted , does each person have his onw code. =A0 is it chemicl or elctrical or both. or physical like the shape o= the protein fiiting in a lolck, or combination of all three. the pr=tein fits. the electri is fired, etc. does the brain send a message. =what does medicine do. does it fool the receiver the sender. t=e listener. the history of telemomininaiotns intercepts =ave a long histroy referring to alice and bob that would like to speak to =ach other, they encrypt their messages. so that a =istener cannot do damge. . why not attack the bio =anguage the same way as speech. have nsa wor= on decrypting the differnce in signals from a cancer cell as oppose= to a helathy one. we know that cells send out messages , am i=in the right place. if they get no answer or the wrong aswer t=ey are programeed to commit suicidce. when a foreigner shows u= in a neighborhhod that is hostile , he is surrounded. k=lld and moved into the trash. he can masquerade as a lo=al. how can the other cells tell. can they ask him=who won the world series. ? . maybe an equivalent. =friend or

foe, ? decoding skills find it difficult to decipher if there is no repetition or action that is the result of the message. =A0 the famous example separate from heil hitler at the end of the message (anecdote or true). to break a code that was received from the germans the allies planned a bomb in three cities all set to blow at the same time, they thought that the word for bank = bomb would be in the message for the day. . or so the story goes.=C2

money what is it . =s it a mirage that disappears when you look too closely, can you have money without debt, is it an accounting system. =C2 what and whys of interest. was it for small communities.=? with the same currency, what is the difference between currency and money, what is the meaning of value,? cost. market. =A0 what is a derivative, futures , stocks bonds, options, derivatives. how does trust fit in, can you have money without trust. in each other in an institution, , what is credit, is it different than money, , social contract. representation. economics. . currency exchange, bitcoin, zero knowledge=proof. ,

'VAULE WORTH COST

inner= state economics. vs outer state ? inner game theory. needed functions. how does one balance inner and outer drive. original works of art are a benefit for inner state. personal art is=nature from grandfather , if they are proven fake , no reality =but huge value change. . value needs to be from each seat in the house. .

if you win the game but violate your principals it is a two dimensional game , that should have a utility function. it is a two dimensional graph, ?=C2 dynamic, does it change over time. ? no answers. as apart from physics due to math.

intelligence= ? speed of thought . algorithms empathy, creativity , survival. . is it a limited resource, maximizing options, =ENVIRONMENT<

distributions, power laws.=C2 biological agents. networks. is gravity merely a restoring force. . pareto . zipf, normal. why are things distributed. central limit theorem randomness. etc.

</iv>

power physical financial all intellectual, political. its uses. dangers getting others to do work, play on the definition. ?
